

Torrance Animal Hospital

Client Information Sheet

Client Information:

Name: (Mr./Mrs./Ms): _____ DOB: _____

Address: _____

City: _____ Zip Code: _____

Phone: Hm: _____ Work: _____ Cell: _____

Social Security: - - CA Drivers License: _____

Employer: _____ Email: _____

Address: _____

City: _____ Zip Code: _____

How did you find out about us? Pet store / Yellow Pages / Google / Yahoo / Internet / Other

Word of Mouth by: _____ (Please Circle applicable)

Patient Information:

Name: _____ Species: _____

Breed: _____ DOB: _____

Color: _____ Sex: M / Neutered Female / Spayed

Canine: Date of, Fecal/Heartworm Test _____ Result: _____

DHLPPC: _____ Bordetella: _____

Rabies 1Yr / 3 Yr : _____ Lyme: _____

Feline: Date of, Fecal /Felv/FIV Test: _____ Result: _____

FVRCP: _____ Leukemia: _____

Rabies 1Yr / 3Yr : _____

Current Health Problems:

- Allergic reaction to Vaccines /Drugs _____
- Diabetes Insulin Dose _____
- Dermatitis _____
- Heart abnormalities _____
- Allergies _____
- Thyroid _____
- Arthritis _____

I certify that I am the owner of the above-mentioned animal.

Veterinary service during nighttime hours, some daytime hours, and/or weekends is provided at the discretion of the veterinarian in-charge. Continuous presence of personnel may not be provided during these hours.

I accept FULL financial responsibility and will pay for all procedures and treatments IN FULL at the time the animal is discharged.

I have read, understood, and received information about prevention and the potential risk of zoonosis such as roundworms, hookworms, toxoplasma, giardiasis, rabies and other zoonotic disease by the staff of Torrance Animal Hospital. I have been informed about the core and non-core vaccines, possible reactions to vaccinations. I have also been informed about NSAIDs, compounded drugs and extra-label drug use. I authorize Staff and Doctors of Torrance Animal Hospital to use any core and non-core vaccines, NSAIDs, compounded pharmaceuticals, and extra label use of drugs on my pet(s) if necessary with my informed consent.

CLIENT ADVISORY

Zoonotic Diseases

The Following are some common zoonotic diseases (transmitted from animals to humans):

Ascarids and Hookworms: Ascarids (*Toxocara canis*, *T. cati*) and hookworms (*Ancylostoma* spp.) are common intestinal parasites of dogs and cats (referred to here as pets). Not only can ascarids and hookworms cause disease in their respective hosts, they are also well-known causes of larva migrans syndromes in humans, especially children. While ascarids and hookworms are most commonly diagnosed in puppies and kittens, infections can occur in dogs and cats of all ages. Dogs can also become infected with *Baylisascaris procyonis*, the common raccoon ascarid, which can cause serious disease in other animals and humans.

Scabies: Scabies is an infestation of the skin with the microscopic mite *Sarcoptes scabiei*. Infestation is common, found worldwide, and affects people of all races and social classes. Scabies spreads rapidly under crowded conditions where there is frequent skin-to-skin contact between people, such as in hospitals, institutions, child-care facilities, and nursing homes.

Cat scratch disease: Cat scratch disease (CSD) is a bacterial disease caused by *Bartonella henselae*. Most people with CSD have been bitten or scratched by a cat and developed a mild infection at the point of injury. Lymph nodes, especially those around the head, neck, and upper limbs, become swollen. Additionally, a person with CSD may experience fever, headache, fatigue, and a poor appetite. Rare complications of *B. henselae* infection are bacillary angiomatosis and Parinaud's oculolymphatic syndrome.

Giardia: The *Giardia* parasite lives in the intestine of infected humans or animals. Millions of germs can be released in a bowel movement from an infected human or animal. *Giardia* is found in soil, food, water, or surfaces that have been contaminated with the feces from infected humans or animals. You **can** become infected after accidentally swallowing the parasite

Rabies: Rabies is a disease caused by the rabies virus. It may take several weeks or even a few years for people to show symptoms after getting infected with rabies, but usually people start to show signs of the disease 1 to 3 months after the virus infects them. The early signs of rabies can be fever or headache, but this changes quickly to nervous system signs, such as confusion, sleepiness, or agitation. Once someone with rabies infection starts having these symptoms, that person usually does not survive. This is why it is very important to talk to your doctor or health care provider right away if any animal bites you, especially a wild animal.

Ringworm: Ringworm is not a worm at all. It is a disease caused by a fungus. Ringworm is a skin and scalp disease caused by several different kinds of fungi. Ringworm on the scalp usually makes a bald patch of scaly skin. People with ringworm on other parts of their skin can have a ring-shaped rash that is reddish and may be itchy. The rash can be dry and scaly or wet and crusty.

Toxoplasmosis: Toxoplasmosis is a disease caused by a parasite called *Toxoplasma gondii*. Most people who get toxoplasmosis do not get sick, but some people will get swollen glands, muscle aches and feel as though they have the "flu". Women who are thinking about becoming pregnant should be especially careful about toxoplasmosis because this disease can infect the fetus and cause a malformation or abortion.

This fact sheet is for information only and is not meant to be used for self-diagnosis or as a substitute for consultation with a health care provider. If you have any questions about the disease described above or think that you may have a parasitic infection, consult a health care provider. **For more info contact <http://www.cdc.gov/>**
